How Could Infrastructure Operators better Support Autonomous Cars?

Kun Zhou

UC Berkeley PATH Program
Could Self-Driving Cars Eliminate Traffic Lights?

• What about pedestrians and cyclists?
• What about people enjoy driving?
• Autonomous cars will have to coexist with human-controlled vehicles and other road users
What if Something Went Wrong?

- Missed seeing a traffic light or failed to detect its state
- Obstructed lines of sight
- Work zones
- ...
- Connectivity and data sharing between vehicles and infrastructure (CAVs)
What Types of Data to Share and How?

• Infrastructure Owners and Operators (IOOs) are looking at
  • Vehicle data and obstacle detection data for traffic signal control
  • Vehicle on-board sensor data for infrastructure maintenance

• What about OEMs?
  • HD MAP
  • Work zones
  • SPaT (Signal Phase and Timing)
  • Security certificates (SCMS)
  • ...

• Raising public awareness and acceptance of CAVs through prototyping and pilot testing
California Connected Vehicle Test Bed

- Green pins: 11 existing intersections
- Red pins: 20 expansion intersections
- Total length is about 7 miles long
- Signal Control Applications
  - Priority for special modes of vehicles
    - Transit, Freight, CAVs
  - Adaptive control utilizing CV data
- Intersection broadcasting messages
  - SPaT – Signal Phase and Timing
  - MAP – Intersection Geographic Description
  - RTCM – GPS position corrections
